Attention

Shusen Wang

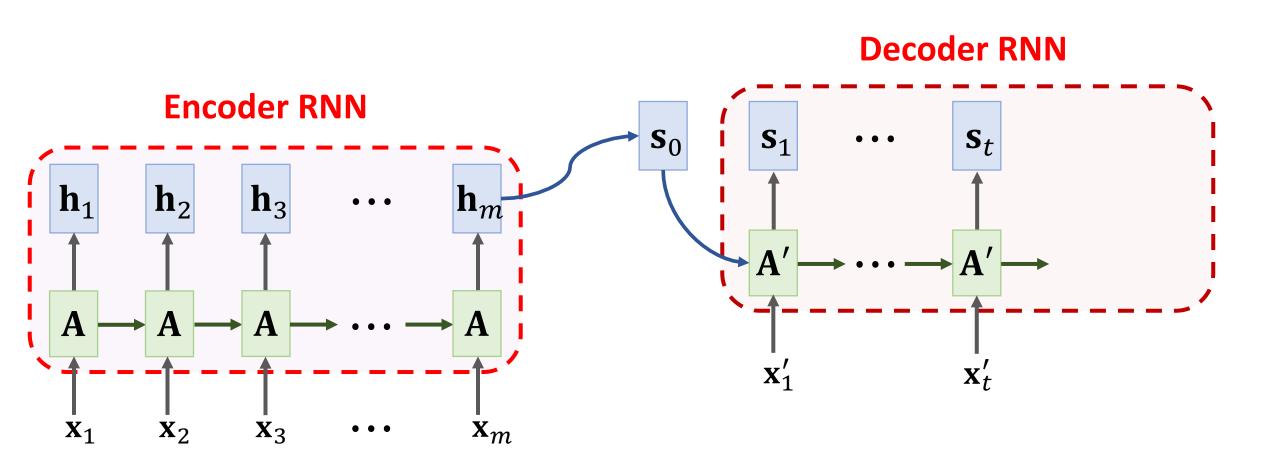

Revisiting Seq2Seq Model

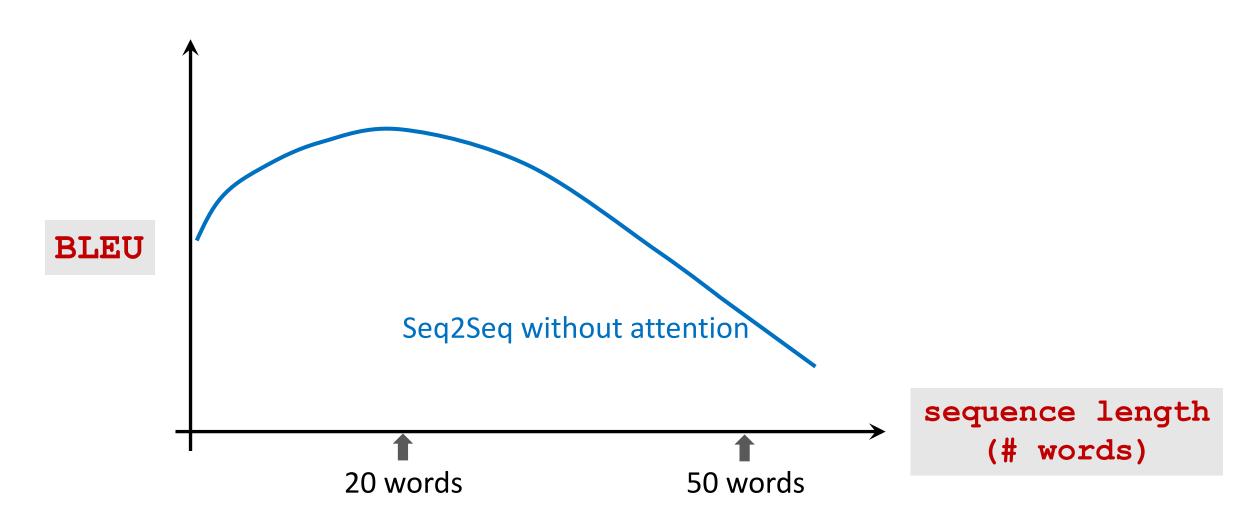

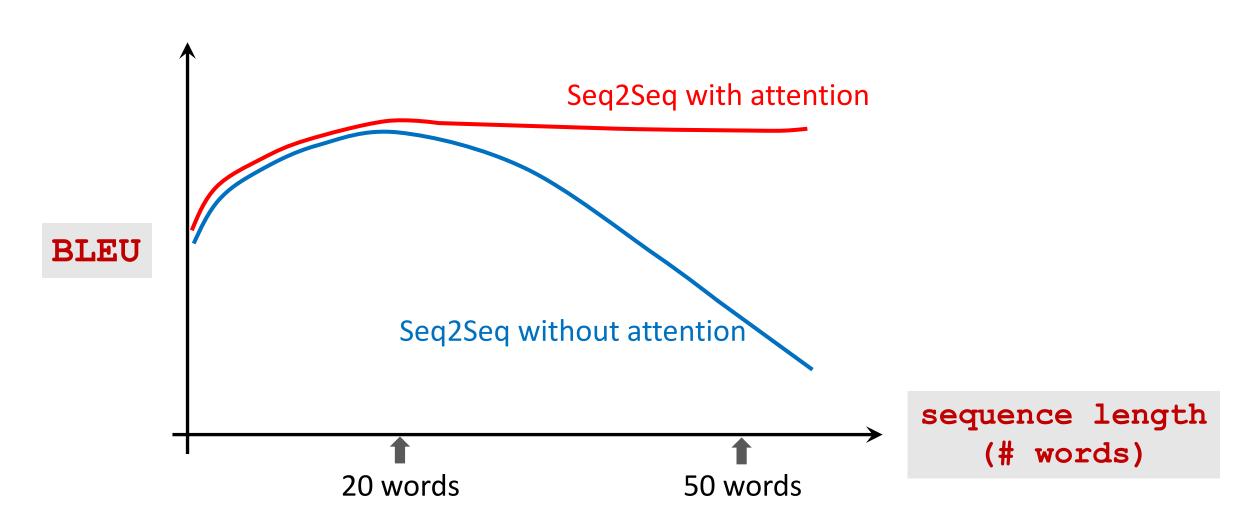

Shortcoming: The final state is incapable of remembering a **long** sequence.

Shortcoming: The final state is incapable of remembering a **long** sequence.

Shortcoming: The final state is incapable of remembering a **long** sequence.

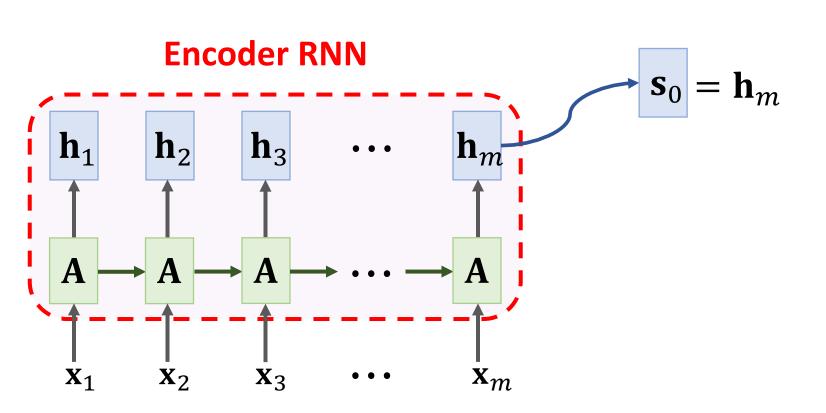

Attention for Seq2Seq Model

Seq2Seq Model with Attention

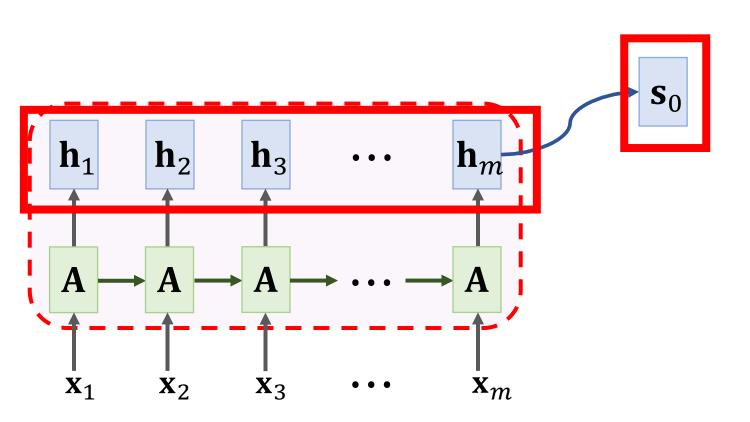

- Attention tremendously improves Seq2Seq model.
- With attention, Seq2Seq model does not forget source input.
- With attention, the decoder knows where to focus.
- Downside: much more computation.

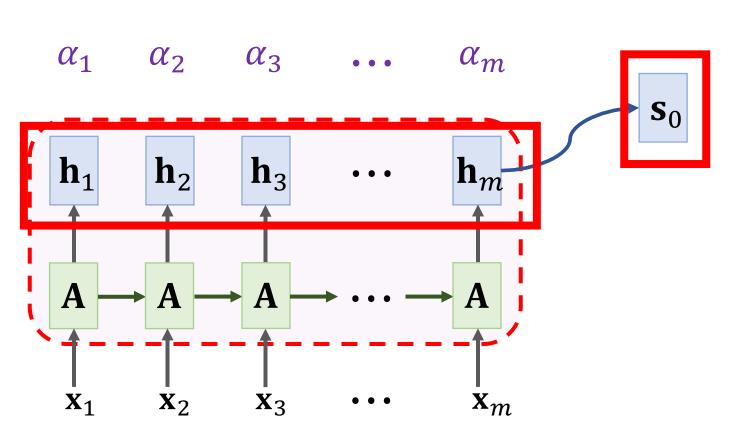

Original paper:

Bahdanau, Cho, & Bengio. Neural machine translation by jointly learning to align and translate.
In ICLR, 2015.

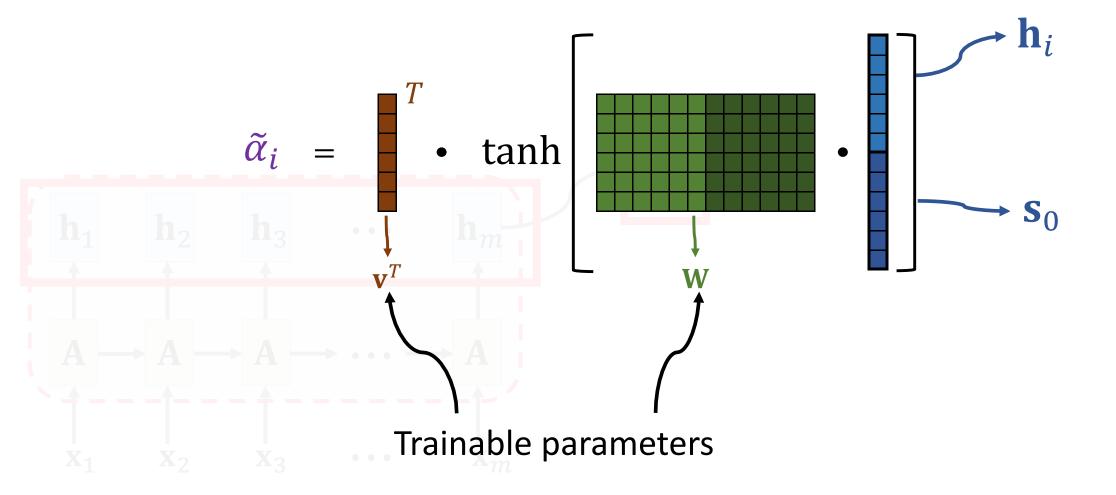

Weight:
$$\alpha_i = \operatorname{align}(\mathbf{h}_i, \mathbf{s}_0)$$
.

Weight: $\alpha_i = \operatorname{align}(\mathbf{h}_i, \mathbf{s}_0)$.

Option 1 (used in the original paper):

Weight:
$$\alpha_i = \operatorname{align}(\mathbf{h}_i, \mathbf{s}_0)$$
.

Option 1 (used in the original paper):

$$\tilde{\alpha}_i = \frac{T}{\text{tanh}}$$

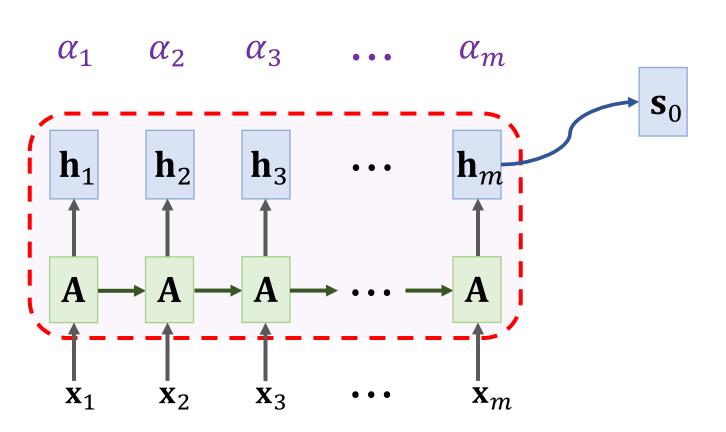

Then **normalize** $\tilde{\alpha}_1, \dots, \tilde{\alpha}_m$ (so that they sum to 1):

$$[\alpha_1, \cdots, \alpha_m] = \text{Softmax}([\tilde{\alpha}_1, \cdots, \tilde{\alpha}_m]).$$

Weight:
$$\alpha_i = \operatorname{align}(\mathbf{h}_i, \mathbf{s}_0)$$
.

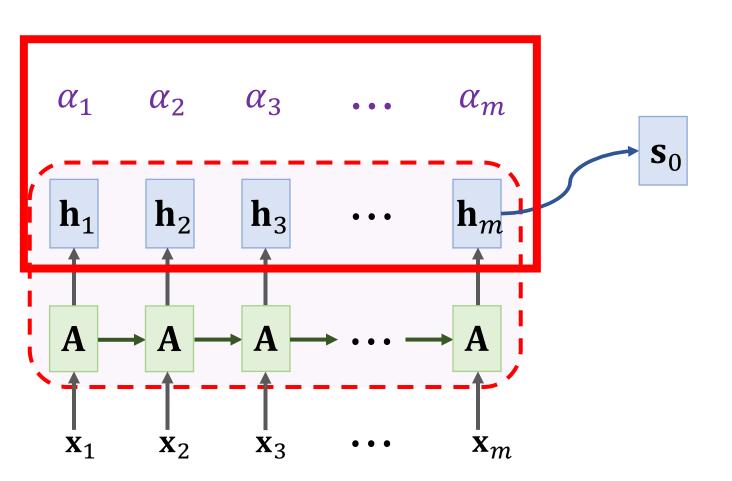

Option 2 (more popular; the same to Transformer):

- 1. Linear maps:
 - $\mathbf{k}_i = \mathbf{W}_K \cdot \mathbf{h}_i$, for i = 1 to m.
 - $\mathbf{q}_0 = \mathbf{W}_O \cdot \mathbf{s}_0$.
- 2. Inner product:
 - $\tilde{\alpha}_i = \mathbf{k}_i^T \mathbf{q}_0$, for i = 1 to m.
- 3. Normalization:
 - $[\alpha_1, \dots, \alpha_m] = \text{Softmax}([\tilde{\alpha}_1, \dots, \tilde{\alpha}_m]).$

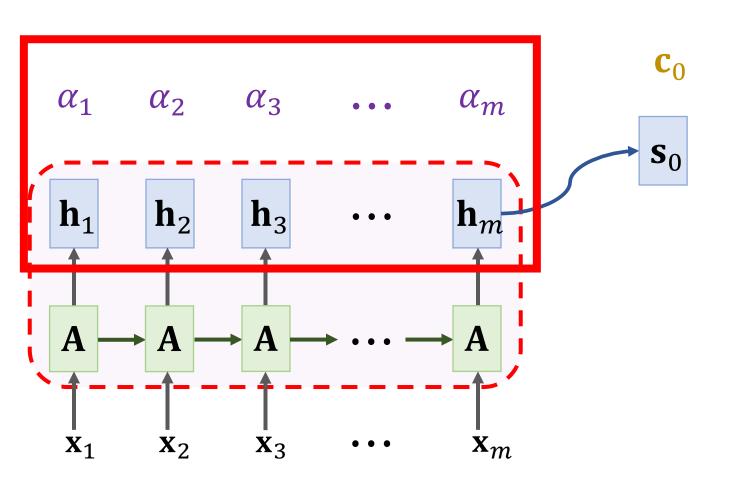

Weight: $\alpha_i = \operatorname{align}(\mathbf{h}_i, \mathbf{s}_0)$.

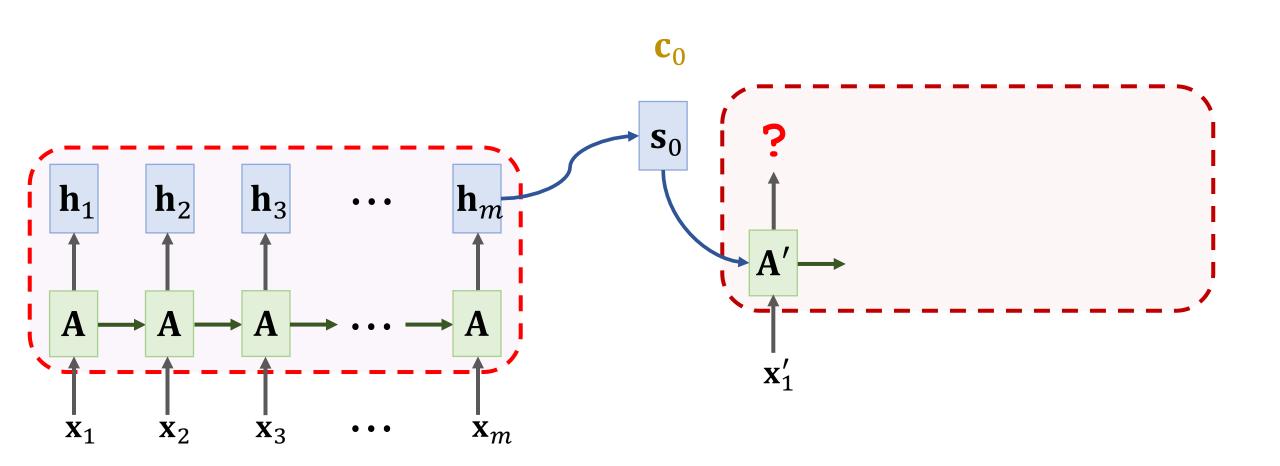

Context vector: $\mathbf{c}_0 = \alpha_1 \mathbf{h}_1 + \cdots + \alpha_m \mathbf{h}_m$.

Weight: $\alpha_i = \operatorname{align}(\mathbf{h}_i, \mathbf{s}_0)$.

Context vector: $\mathbf{c}_0 = \alpha_1 \mathbf{h}_1 + \cdots + \alpha_m \mathbf{h}_m$.

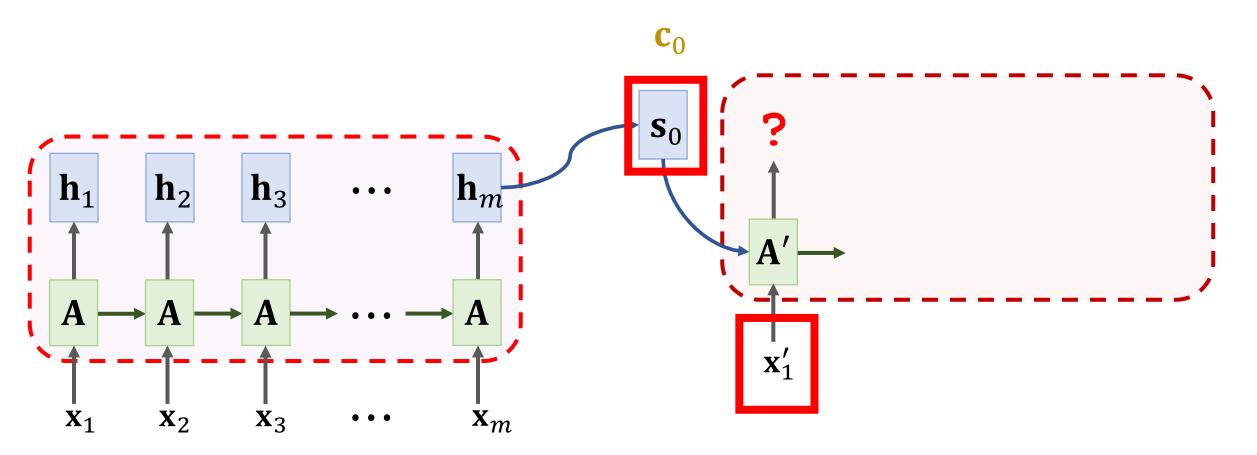

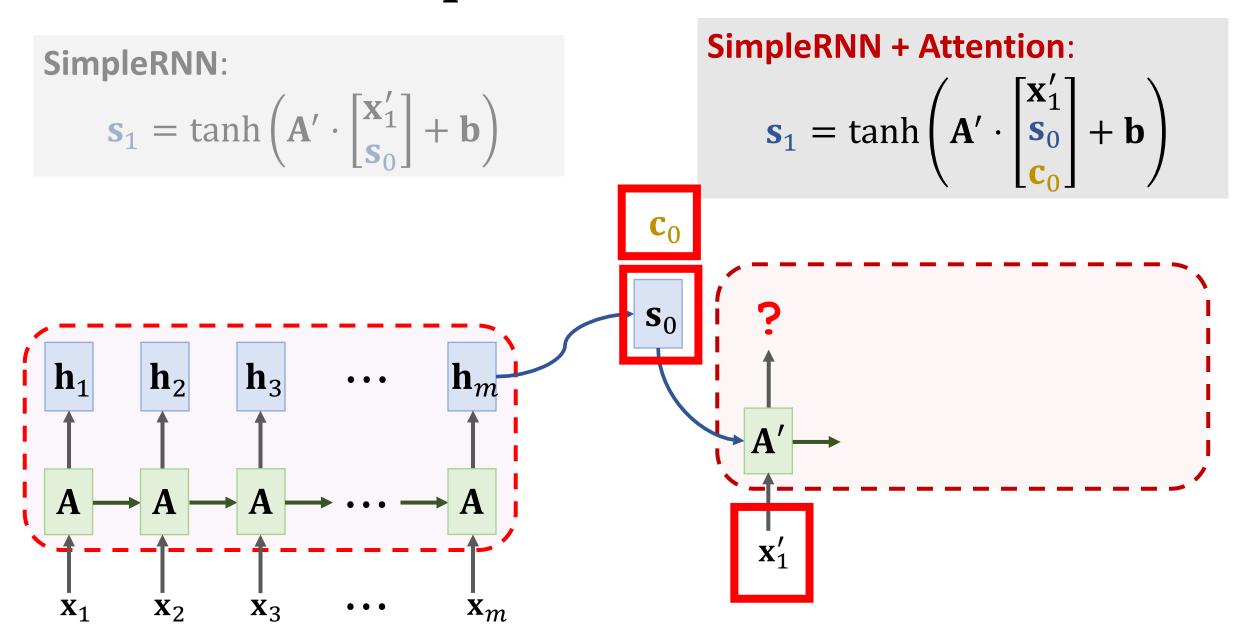

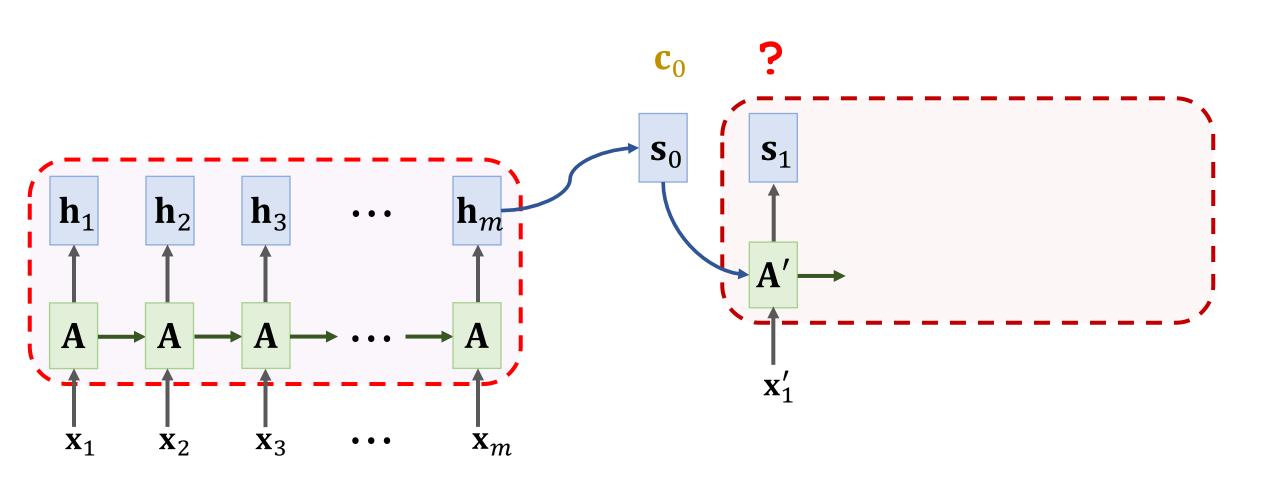

SimpleRNN

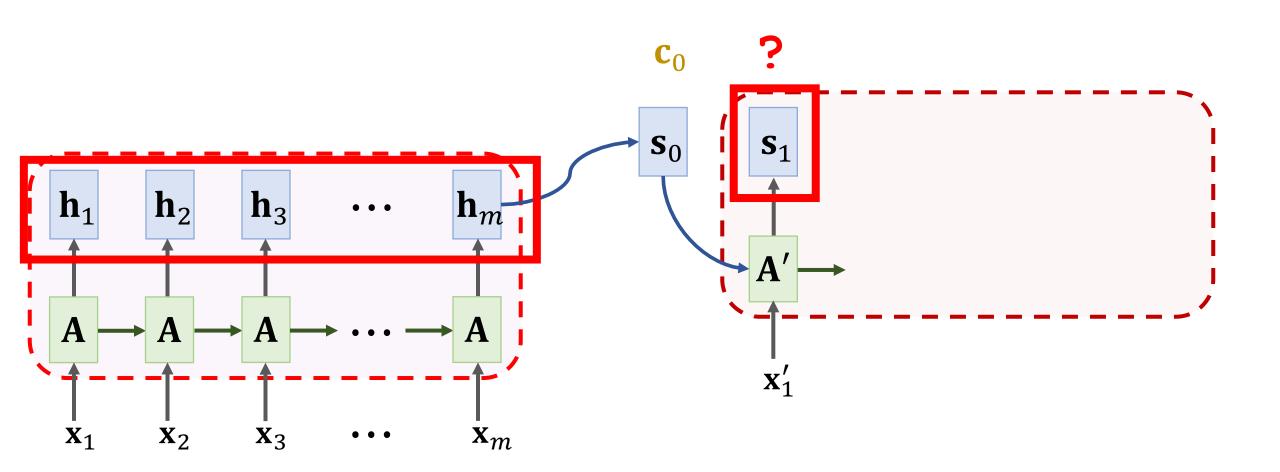

SimpleRNN:

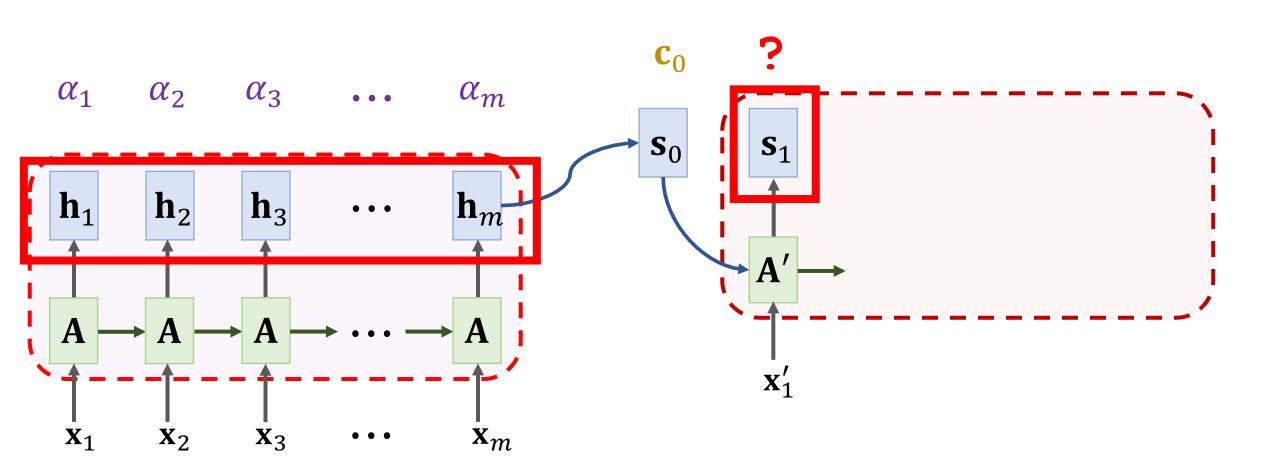

$$\mathbf{s}_1 = \tanh\left(\mathbf{A}' \cdot \begin{bmatrix} \mathbf{x}_1' \\ \mathbf{s}_0 \end{bmatrix} + \mathbf{b}\right)$$

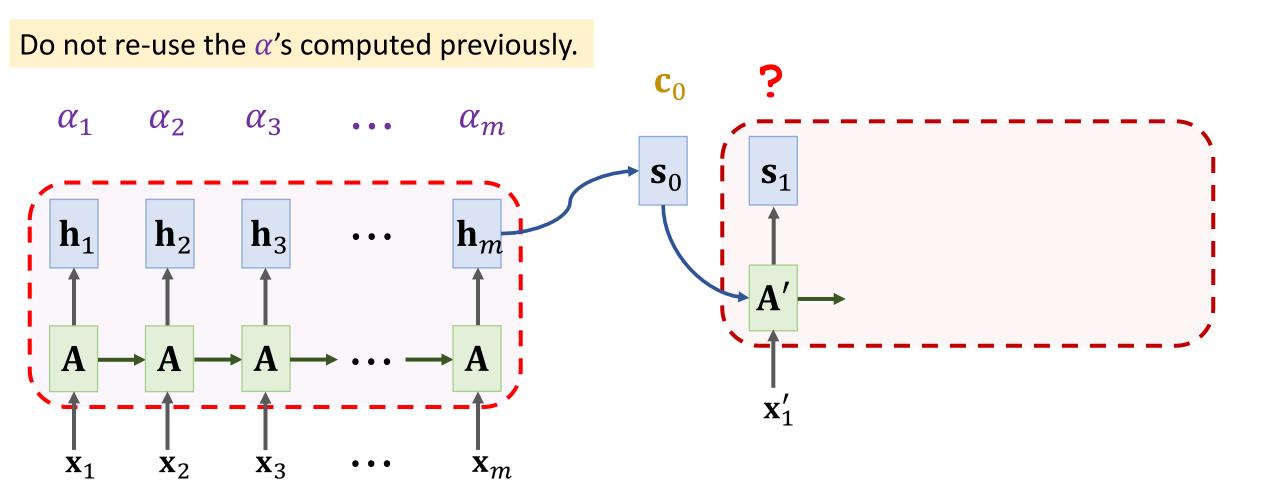

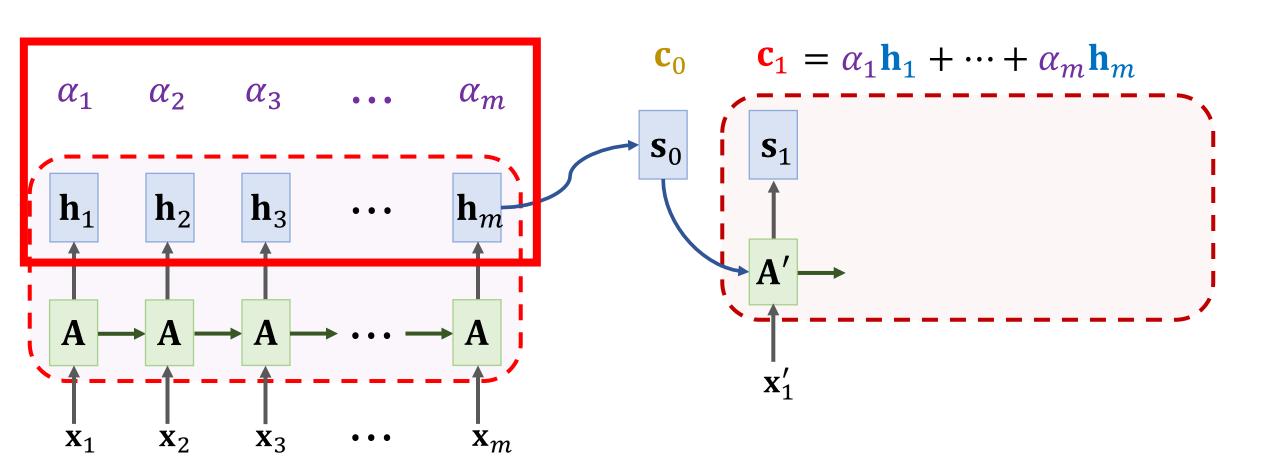

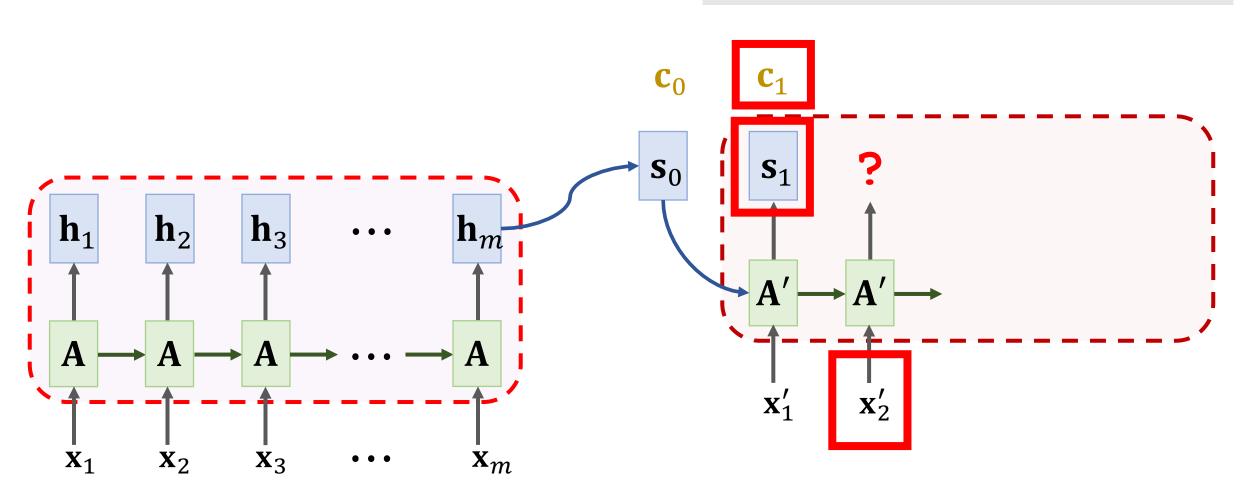

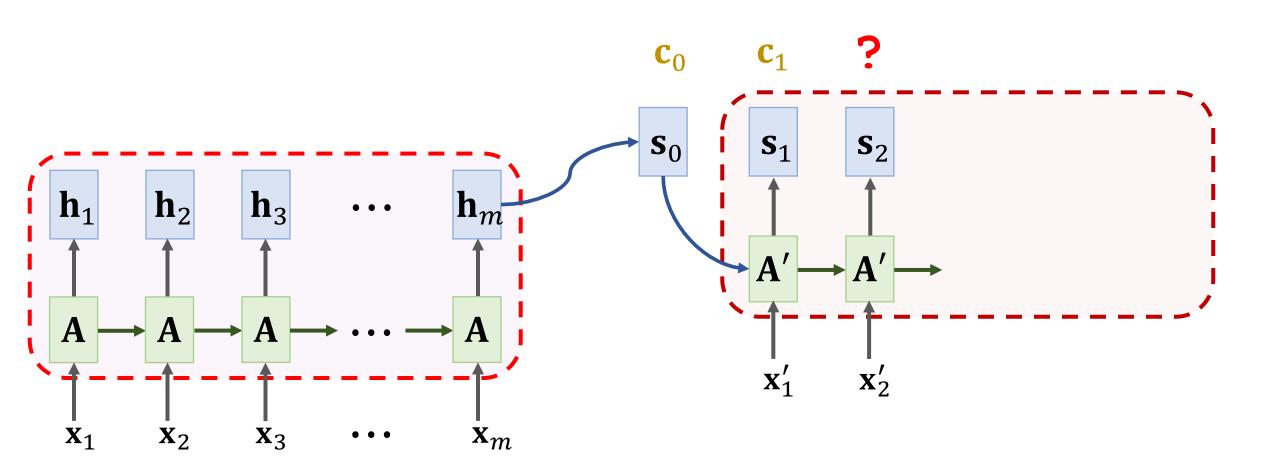

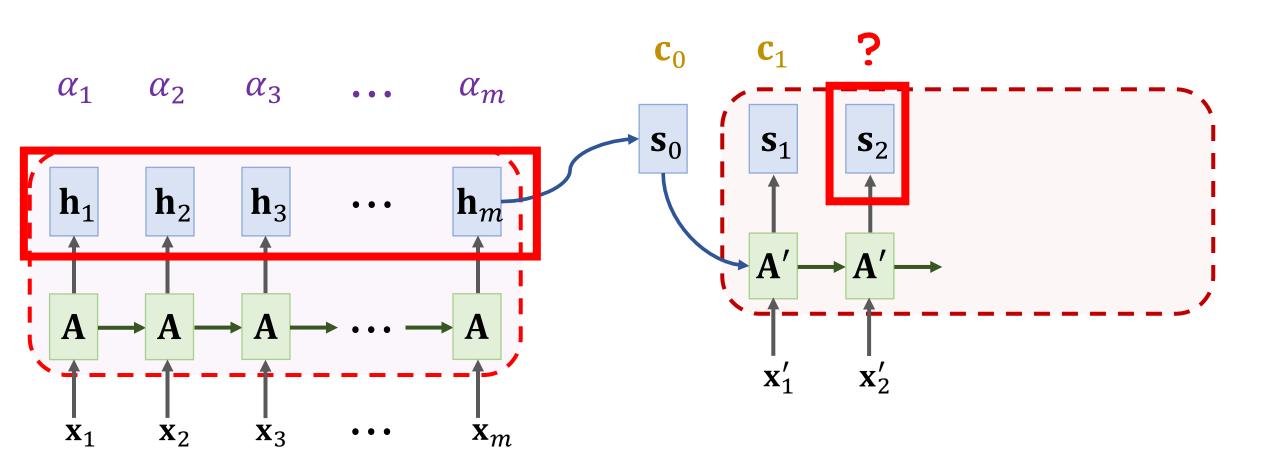

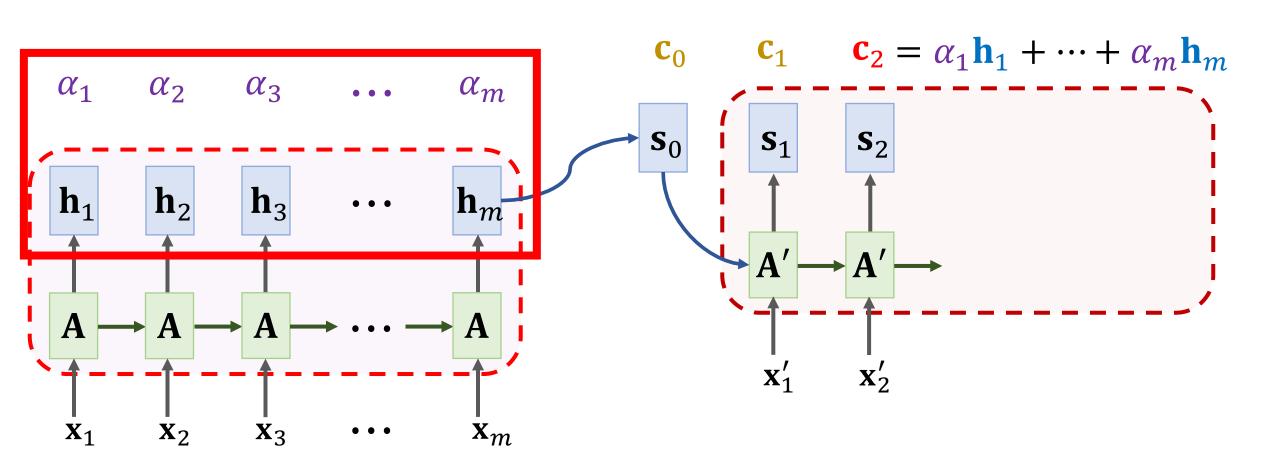

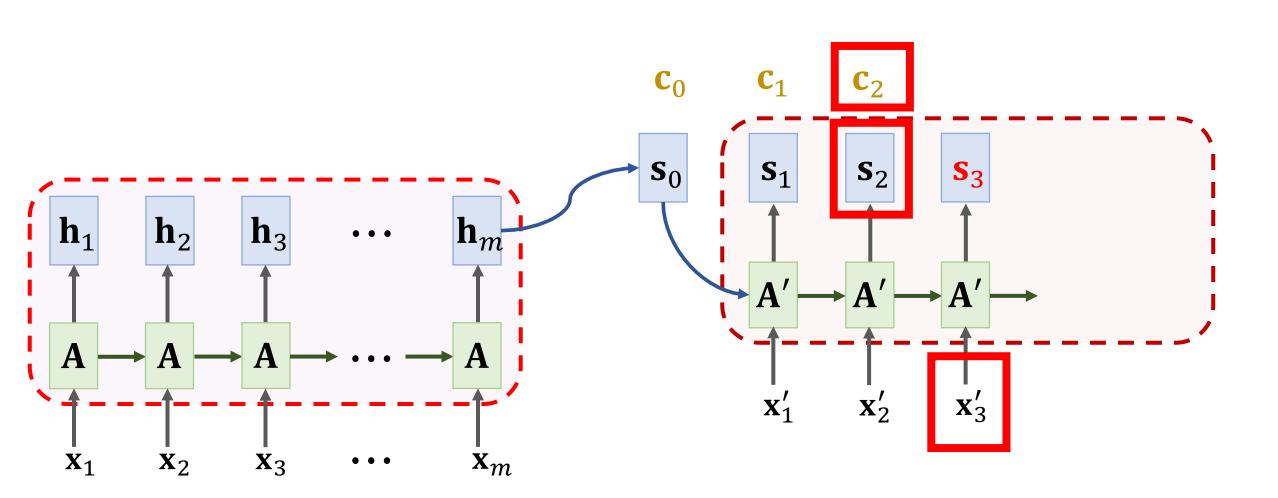

$$\mathbf{s}_2 = \tanh\left(\mathbf{A}' \cdot \begin{bmatrix} \mathbf{x}_2' \\ \mathbf{s}_1 \\ \mathbf{c}_1 \end{bmatrix} + \mathbf{b}\right)$$

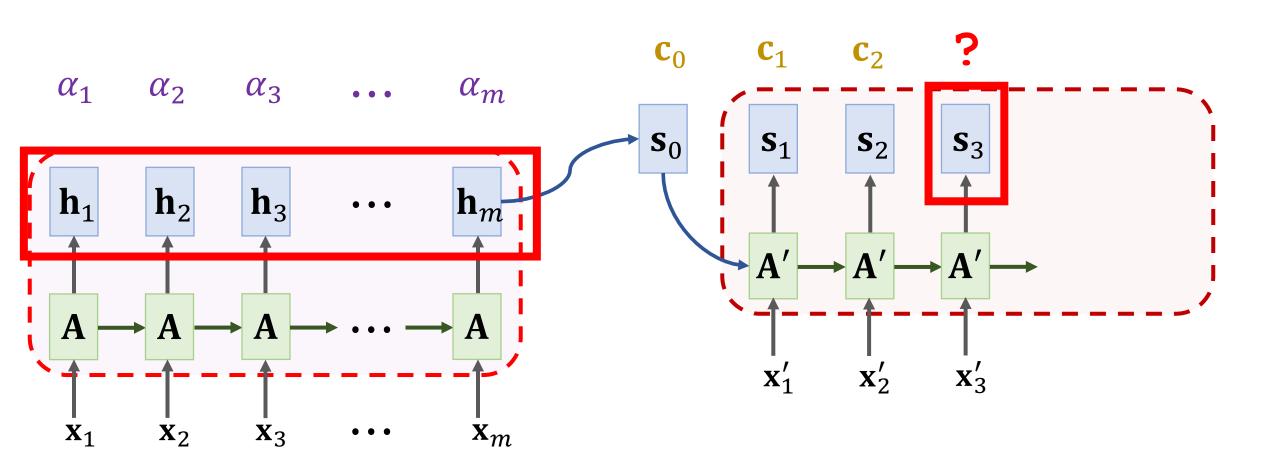

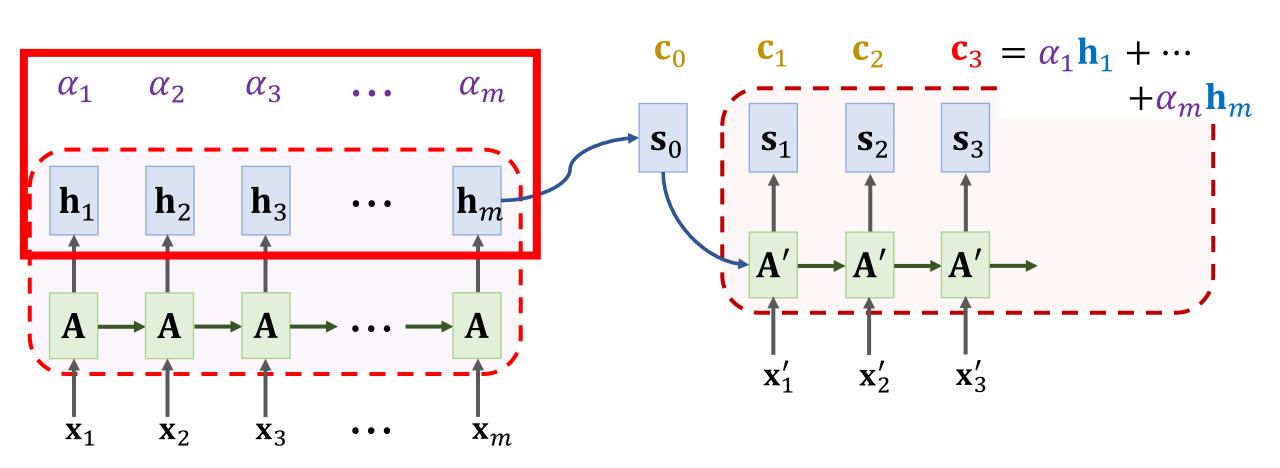

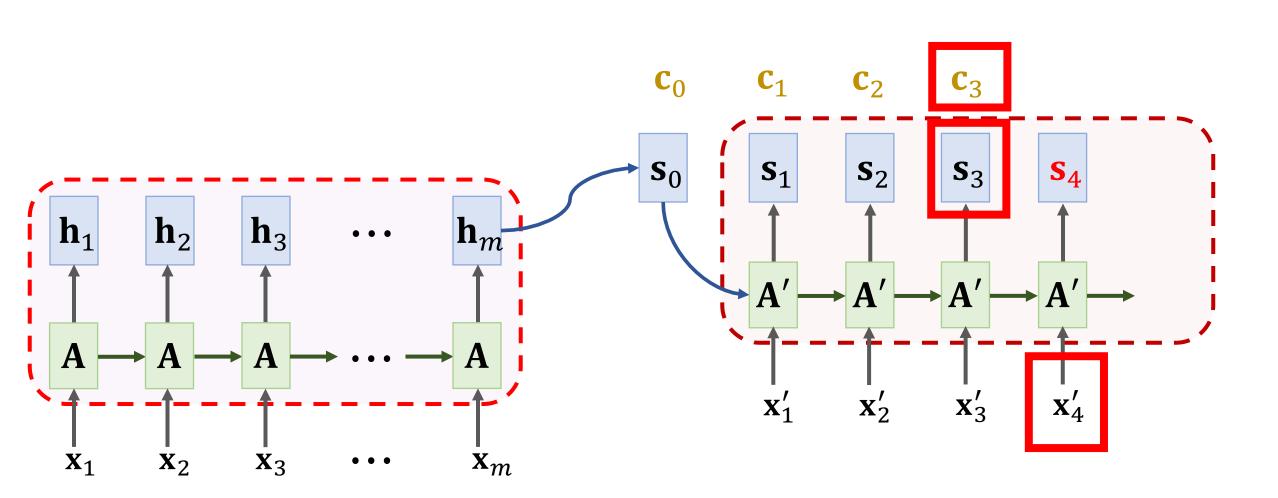

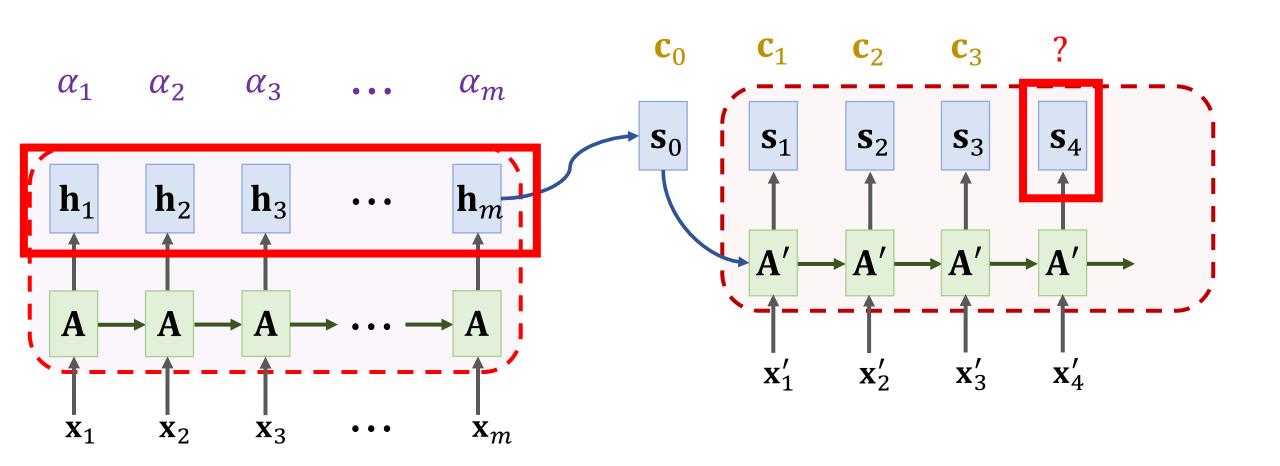

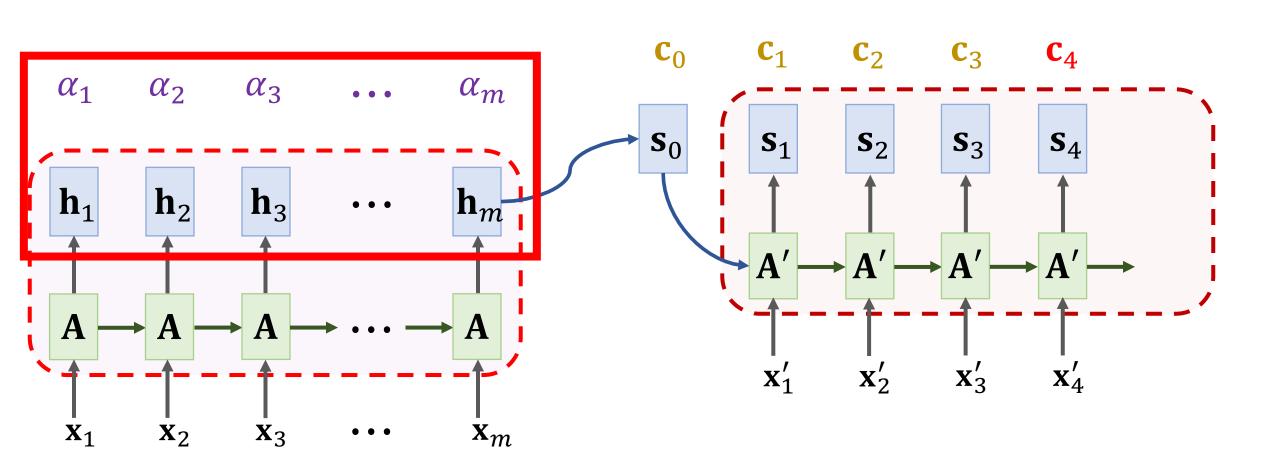

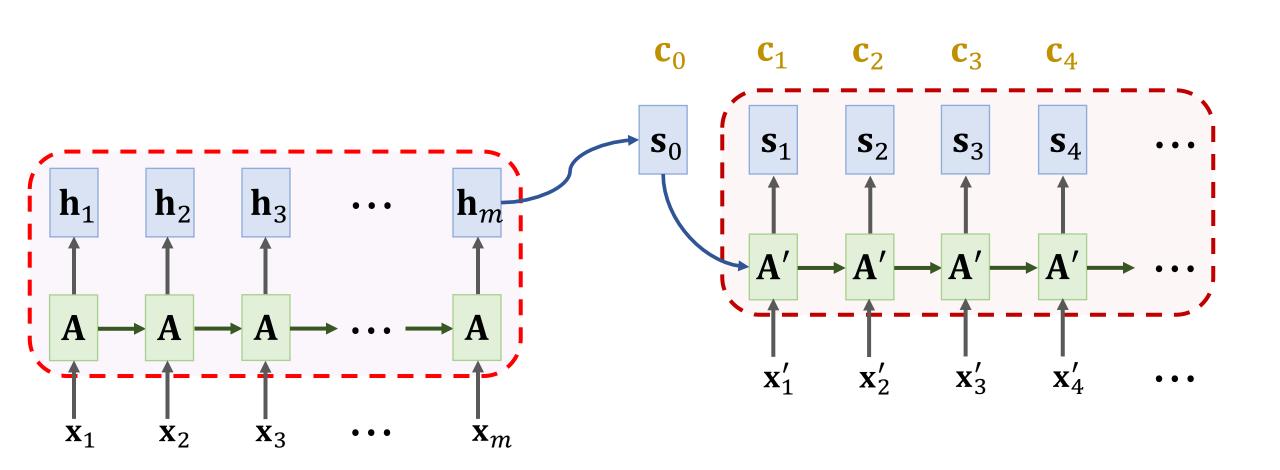

SimpleRNN + Attention

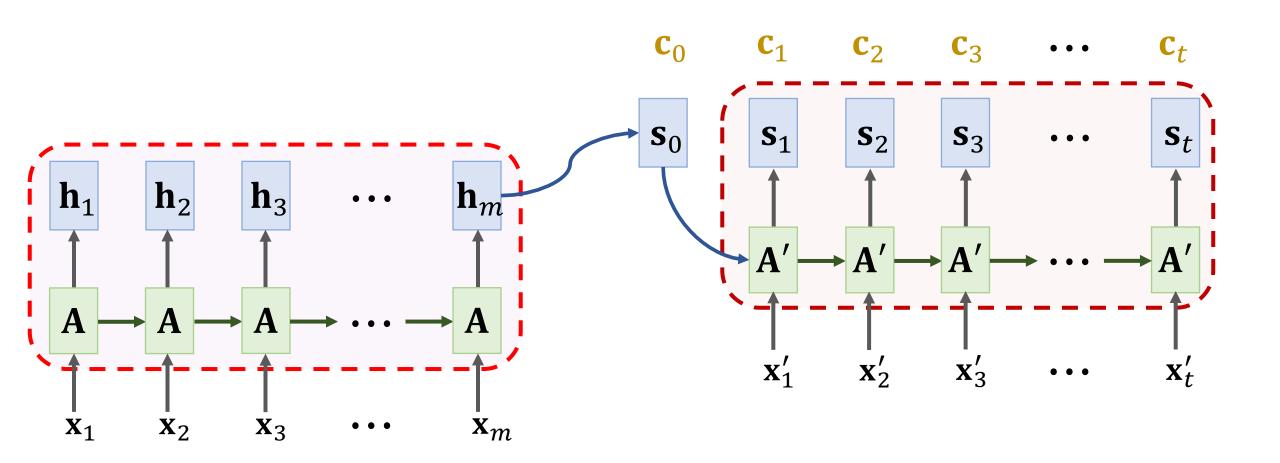

SimpleRNN + Attention

Time Complexity

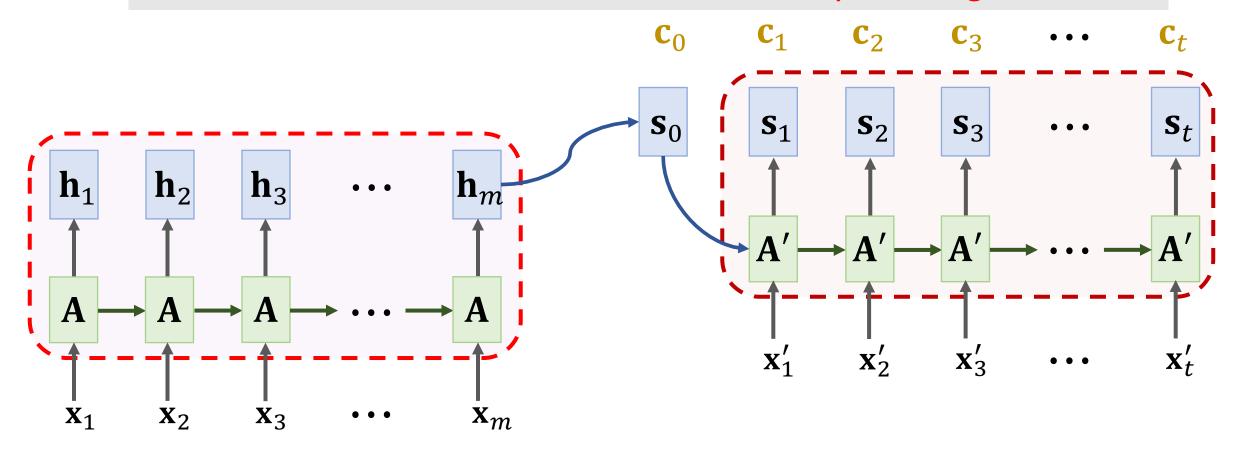

Question: How many weights α_i have been computed?

Time Complexity

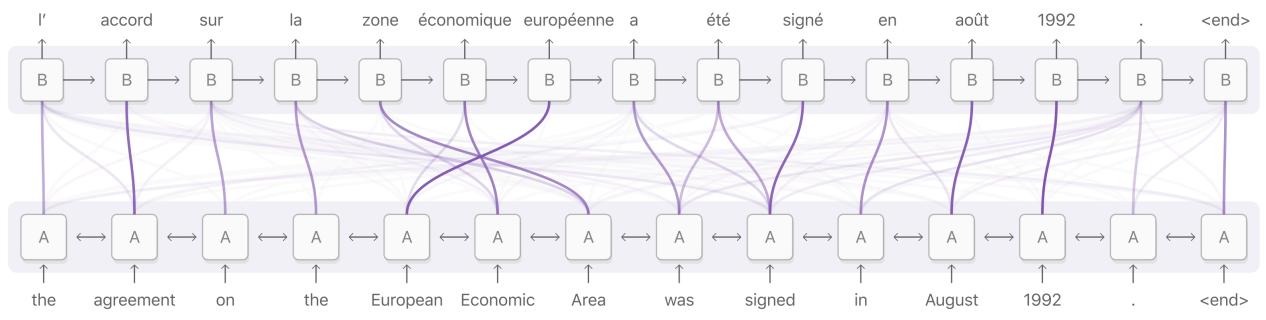

Question: How many weights α_i have been computed?

- To compute one vector \mathbf{c}_i , we compute m weights: $\alpha_1, \dots, \alpha_m$.
- The decode has t states, so there are totally mt weights.

Attention: Weights Visualization

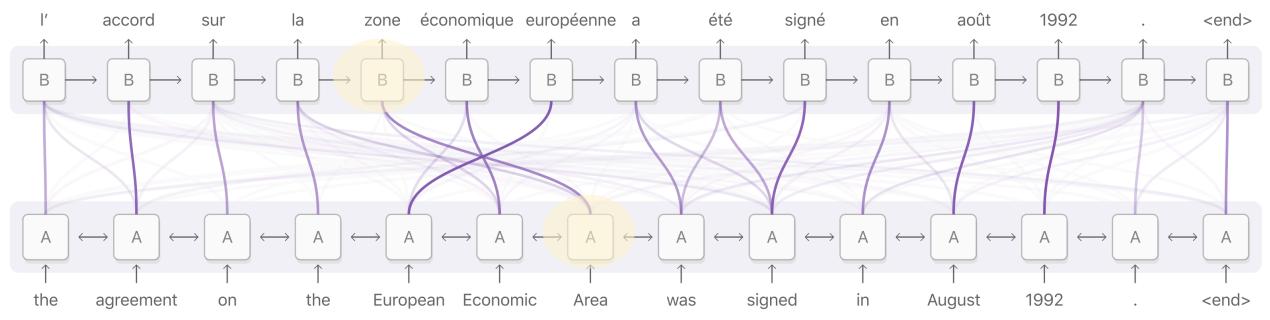

Decoder RNN (target language: French)

Encoder RNN (source language: English)

Attention: Weights Visualization

Decoder RNN (target language: French)

Encoder RNN (source language: English)

• Standard Seq2Seq model: the decoder looks at only its current state.

- Standard Seq2Seq model: the decoder looks at only its current state.
- Attention: decoder additionally looks at all the states of the encoder.

- Standard Seq2Seq model: the decoder looks at only its current state.
- Attention: decoder additionally looks at all the states of the encoder.
- Attention: decoder knows where to focus.

- Standard Seq2Seq model: the decoder looks at only its current state.
- Attention: decoder additionally looks at all the states of the encoder.
- Attention: decoder knows where to focus.

- Downside: higher time complexity.
 - m: source sequence length
 - t: target sequence length
 - Standard Seq2Seq: O(m+t) time complexity
 - Seq2Seq + attention: O(mt) time complexity

Thank you!
